

AI Product & Website Review

Zenith / J.E.R.K. / AllInsight / AI4Education

AI Intern Assignment – Product Analysis & Improvement Opportunities

I would also love the opportunity to interact with your team, work with you, and contribute to your projects. I am excited to learn from your team, apply my AI/ML skills to real-world problems, and contribute wherever I can add value. I would be happy to grow and learn while working with your team.

Prepared as a product-focused work sample

August 2026

1. Summary

1. Initial Website & UX Observations

When I was reviewing your website, I found several bugs and areas that could be improved. The first issue I noticed was:

● Issue 1 — “Send Message” Button

This was one of the most noticeable UI issues.

The purple button container is centered, but the “Send Message” text does not look properly aligned vertically and horizontally inside the button.

This makes the button look slightly unpolished and affects the overall user experience.

● Issue 2 — Message Icon Positioning

The message icon inside the textarea looks slightly awkward because it is positioned too close to the top-left corner.

The other input fields have a consistent visual pattern:

- Name → Person icon
- Email → Email icon
- Message → Message/Chat icon

Using a message or chat icon here is logical, but its position and spacing should match the padding of the textarea.

● Issue 3 — Default Theme Color Not Applied Correctly

When I switched the theme to “DEFAULT”, I expected the interface to use the default purple color shown by the theme indicator.

However, the website is still showing yellow/gold elements in places such as the logo, buttons, and other UI components.

This makes it unclear whether the “DEFAULT” theme is actually being applied or whether some elements are keeping the previous theme color.

● Issue 4 — Default Theme Color Not Applied Correctly

When I switched the theme to “DEFAULT”, I expected the interface to use the default purple color shown by the theme indicator.

However, the website is still showing yellow/gold elements in places such as the logo, buttons, and other UI components.

This makes it unclear whether the “DEFAULT” theme is actually being applied or whether some elements are keeping the previous theme color.

Conclusion → What effect on the user and clients.

These issues may negatively affect the overall user experience and first impression of the website. Even though the underlying products and services may be strong, small UI bugs and non-working interactions can make users feel that the website is not fully polished or properly tested.

A user may think that if basic website elements such as buttons, themes, icons, and FAQ interactions are not working correctly, the overall website may also not be reliable.

Therefore, fixing these issues would help improve the website's usability, professionalism, and user trust

Now, moving from the website UI issues to the services and products offered by Zenith India

Service Problem 1 — AI Chatbot Is Not Demonstrated on the Website

While reviewing [Zenith's services](#), I noticed that the company offers AI chatbot development, but the website mainly provides a WhatsApp chat option for communication.

If the [WhatsApp system](#) is powered by AI, it can still be considered an AI conversational solution. However, from a visitor's perspective, there is no clear AI chatbot experience or demo available directly on the website.

A better approach would be to first provide an AI chatbot directly on the website and train/ground it with the company's information using a RAG-based knowledge system. The chatbot could be provided with relevant information about Zenith's:

- Services
- Products
- Company
- FAQs
- Contact information
- Policies
- Other important business information
-

For example:

Website Visitor → AI Chatbot → RAG Knowledge Base → Relevant Answer

Once the user wants to continue the conversation or contact the company, the chatbot could then provide an option such as:

"Continue this conversation on WhatsApp"

This would allow Zenith to use both an on-site AI chatbot and WhatsApp, rather than relying only on the WhatsApp entry point.

Why this would be better

This approach would allow visitors to experience Zenith's AI capability before contacting the company. It would also act as a live demonstration of the chatbot-development service that Zenith is offering to its own customers.

Product Improvement — AI Search & Recommendation System

While reviewing the [BabyDino product section](#), I noticed an opportunity to improve product discovery, especially for products such as kids' bags, stationery, keychains and toys.

For example, if a customer is looking for a school bag for a 10-year-old, instead of manually checking multiple products, an AI-powered search system could understand the customer's requirement and show the most relevant products.

The system could consider:

- Product category
- Age group
- Product type
- Price range
- Product description
- Similar products
- Previous searches
- Products viewed or purchased

How I would approach it

User Search

Query Understanding

Product Search / Retrieval

Recommendation Model

Relevant Products

Product -2 JERK

What J.E.R.K. is doing

J.E.R.K. is building an AI-powered trend intelligence platform that collects signals from sources such as social media, search, retail and editorial content to identify emerging trends before they become mainstream.

Its main value is:

Identify what is starting to trend → measure its growth → understand where it is happening → help brands and professionals make better decisions.

It claims to monitor 150+ countries, 900+ data streams and 40+ categories, covering areas such as fashion, technology, food, beauty, design and entertainment.

“J.E.R.K. already has strong AI capabilities across trend forecasting, colour intelligence and personal styling. The next opportunity is to connect these capabilities more tightly and turn the generated intelligence into clear, explainable and actionable recommendations.”

Improvement 1 — Make AI Insights More Actionable

J.E.R.K. already provides a lot of useful trend data and market intelligence. However, a business user may still have one important question after seeing the data:

“I understand the trend, but what should I do with this information?”

For example, instead of only showing:

Marigold +5.9%

ColorMarket could also provide a clear recommendation:

“Marigold is showing strong momentum in festive fashion. Consider testing this colour in your upcoming festive collection.”

This would help users move from understanding the trend to taking action based on it.

Improvement 2 — Explain Why the AI Reached Its Conclusion

Products like TrendRaga and ColorMarket provide AI-generated insights that could influence important business decisions. Therefore, users should be able to understand why the AI reached a particular conclusion.

For example:

Trend Score: 86/100

Key Signals:

- Search growth ↑
- Social media mentions ↑
- Retail demand ↑
- Editorial coverage ↑

Confidence: High

Providing these supporting signals would make the AI results more transparent, understandable, and trustworthy.

Suggested improvement:

Add a “Why this result?” or “Key Signals” section alongside major AI predictions and recommendations.

Improvement 3 — Trend Alerts and Notifications

J.E.R.K. provides daily updated trend signals, so users may not want to continuously check the dashboard for important changes.

A useful improvement would be to allow users to follow specific trends, colours, categories, or markets and receive notifications when something important changes.

For example:

 Butter Yellow increased by 8% this week in Womenswear.

Or:

 A new emerging trend has been detected in Indian festive fashion.

Users could choose which trends or categories they want to monitor and receive relevant alerts.

Improvement 4 — Historical Comparison

For trend forecasting, looking at the current value alone is not always enough. Users should also be able to compare how a trend has changed over time.

Useful comparison options could include:

- Current vs. Previous Month
- Current vs. Previous Season
- 2025 vs. 2026

For example:

Cherry Red

2025 → Low

Early 2026 → Rising

Current → Strong

Forecast → Medium/High

This would help users easily understand the direction and growth of a trend, rather than looking at only its current position.

As a Customer or Client or First time user ---> Not for Improvement this my perspective

Make the Website Easier to Understand

When I reviewed the J.E.R.K. website for the first time, I found that it offers many different features and products, such as:

- Trends
- TrendRaga
- ColorMarket
- StyleMind
- Color Intelligence
- Editorial
- Expert Network
- Services

The number of features shows that J.E.R.K. has a lot to offer, but from a first-time user's perspective, the website can feel slightly complex and overwhelming. It may take some time for a new visitor to understand which product or service is most relevant to them.

Product - 3 AllInsight

What does AllInsight do?

AllInsight is an AI education and learning platform.

Its main goal is to help students and professionals learn how to use Generative AI effectively, especially through prompt engineering and practical AI skills.

What I Like About the Product

One of the strongest aspects of AllInsight is its domain-specific approach to AI learning.

Different professionals have different requirements, so they do not necessarily need to learn or use the same prompts.

For example, a Data Analyst may want to learn:

“How can I use AI to clean a dataset, generate Pandas code, and identify useful insights?”

Whereas a Marketing professional may want to learn:

“How can I use AI to create effective ad campaigns and analyse customer objections?”

By focusing on real professional use cases, AllInsight makes AI learning more practical and relevant instead of teaching prompt engineering only as a theoretical concept.

● Improvement 1 — Add an AI-powered learning assistant

Since AllInsight itself is an AI education platform, an interactive AI tutor could make the learning experience much stronger.

For example, if a learner is studying Data Analysis and gets stuck, they could ask:

“I don't understand why this prompt is giving me a poor result.”

The AI tutor could explain the problem and guide the learner rather than simply giving the final answer.

● Improvement 2 — Show measurable skill improvement

The platform could show users how their skills are improving over time.

For example:

Prompt Quality Score

Before:

52/100

After completing the exercises:

84/100

The platform could evaluate things such as:

- Clarity
- Context
- Constraints
- Output format
- Reasoning structure
- Task-specific effectiveness

This would make progress more visible to the learner.

I think AllInsight has a clear idea:

Teach people how to use Generative AI effectively across different professional domains.

Its strongest point is the domain-specific learning approach.

The biggest opportunity, in my opinion, is to move further from learning about prompting toward learning by doing.

A stronger learning loop could be:

Learn → Practice → Get AI Feedback → Build Project → Measure Skill → Get Certified

That would make the platform more practical and valuable for students and professionals.

Product - 4 AI4Education

AI4Education

AI4Education helps Class 6–10 students learn smarter through AI-powered quizzes, flashcards, and personalized learning paths. It aims to make learning more interactive and tailored to each student's strengths and weaknesses.

Important Improvements I Would Suggest

1. AI Doubt Solver

An AI tutor that can understand students' questions and explain the answer step by step in simple language, according to their class level.

2. Intelligent Mistake Analysis

The system can analyse students' wrong answers and identify where they are making mistakes or which concepts they do not understand well.

3. Personalized Recommendation Engine

The system can analyse a student's past performance, quiz scores, and mistakes and automatically recommend what the student should study or practice next.

What I Like Most ?

I liked the Audio Lessons feature the most because it makes learning more interactive and easier to understand. Students can learn by listening to explanations, which can be especially helpful when they find reading or understanding a topic difficult.

As an AI/ML Engineer, I suggested the improvements that I felt were relevant to my domain, such as AI-based doubt solving, intelligent mistake analysis, and personalized recommendations. I also suggested some frontend improvements based on my current frontend knowledge to make the platform more user-friendly and engaging. These are the main improvements I could identify from my side based on my AI/ML and frontend skills.
